

For those of you who have been to any of the association meetings in the last few years, you will know that our low water levels now are because of 5 or 6 years of far below average annual moisture. There has not been any water over the dam in that entire time. Yes, we do have a water management problem, for the future when, with luck, water levels return to their normal levels. Your RLPOA board is doing everything possible to resolve this issue with the county, DNR, and LCO. The temporary restraining order is our latest action to block the transfer the culverts at NN from the County to LCO. In so doing it is our hopes that we can get the county to implement a active water management plan which will address both high and low water conditions on our lake.

Soooooo, for the near future, if any of you have any pull with the guy upstairs, have him keep delivering as much rain as possible. Level is up a few inches after our recent rains, but we can use much more.

Frank Tyson
RLPOA board/water quality committee.
