A “regional analysis” shall be a broad analysis of local and regional factors based upon information that is reasonably available and is supported by credible scientific evidence, and shall, wherever applicable, include an analysis of the following:

1. Land ownership and land use patterns;
2. Cultural resources;
3. Biological diversity, including natural communities and their distribution;
4. Ecological capability data;
5. Recreation resources and their use, capability and demand;
6. Socio-economic conditions and benefits, including local economies; and
7. Other issues germane to managing natural resources and public use.
